Sales & Inventory Management System (Grocery Store)

Project Overview

A web-based application built to manage sales and inventory for a grocery store (penjualan sembako). This project demonstrates core web development skills including backend logic, database management, and reporting features.

Key Features

- Role-Based Access Control: Secure login system with different access levels for Admin and Staff.
- Inventory Management: Comprehensive system to track grocery items and stock levels.
- Automated Reporting: Capability to generate and export sales reports into Excel and PDF formats.
- Transaction Tracking: Real-time monitoring of daily sales and transactions.

Technical Stack

- Backend: PHP (Native)
- Database: MySQL
- Frontend: HTML5, CSS3, JavaScript

How to Setup

1.Import the penjualan_sembako.sql file located in this root folder into your MySQL database.

2.Update the database configuration in the config/ folder if necessary.

3.Access the application via your local server (e.g., Laragon or XAMPP).

4.Check the screenshots/ folder to see the application interface and sample reports.
